

360 Lantern

Intro

The 360 Lantern is an established handheld lantern modified and equipped with a 360 Static Detector that employs 3 AA batteries. It encompasses blight white lantern LED's and eight LEDs, two Red, two Yellow, two Green, and two Blue. In 360 mode upon detecting static, the 360 will illuminate LEDs as per the static it has detected. This advanced functionality theoretical enables the user to request the spirits to activate a specific side, a particular color or allow the 360 to interact with them. In lantern mode the unit works as a standard lantern lighting the way as you walk in the dark.

Setup and Use

The 360 Lantern requires 3 AA batteries that are to be inserted in the bottom. Unscrew the bottom cover to expose the battery compartment. Attach the included antenna to the top of the 360 Lantern. While the 360 Lantern can be used with or without the antennas, we recommend testing with and without to ensure optimal performance. Attaching the antenna is easy - simply screw it onto the antenna stud and hand-tighten without excessive force. To turn on the 360 slightly pull up on the handles while holding the lower section. The switch on the top of the 360 toggles the mode.

Mode

Lantern - Switch down toward the front for lantern mode. Adjusting the height of the lantern allows you to vary the lanterns brightness. Push top down fully to turn device off.

360 - Switch up towards the back of the 360 Lantern for 360 mode. After switching to 360 mode, it may accumulate a charge from the static on your body. Please allow 30-60 seconds for the detector to discharge on its own. If it fails to discharge, try touching the antenna to release the static charge. The 360 is ready to use when all 8 LEDs turn off. Push the top back fully to turn device off.
